Kidney function tests are performed for a variety of reasons, including something as simple as a yearly checkup, or a urinary tract infection is suspected. They may also be performed if an individual is ill and a diagnosis has not been made, as a screening test for a patient planning or recovering from surgery, or as a way to track kidney disease.

A simple test can be done to detect protein in your urine. Persistent protein in the urine is an early sign of chronic kidney disease. Microalbuminuria: This is a sensitive test that can detect a small amount of protein in the urine. Urine Creatinine: This test estimates the concentration of your urine and helps to give an accurate protein result. Protein-to-Creatinine Ratio: This estimates the amount of protein you excrete in your urine in a day and avoids the need to collect a 24-hour ...

Tests to Measure Kidney Function, Damage and Detect Abnormalities Healthy kidneys remove wastes and excess fluid from the blood. Blood and urine tests show how well the kidneys are doing their job and how quickly body wastes are being removed.

Tests to Measure Kidney Function, Damage and Detect ...

Summary. The kidney plays a central role in fluid, electrolyte, acid-base, and mineral balance. It contributes to the regulation of erythrocyte production via erythropoietin, and glomerular damage can result in serum albumin abnormalities. Therefore, while blood urea nitrogen (BUN) and serum creatinine (Cr) are the most common indicators of kidney function, many other serum biochemical analytes can be influenced by renal disease and should be evaluated in conjunction with the BUN and Cr.

Your health care provider will use a blood test to check your kidney function. The results of the test mean the following: a GFR of 60 or more is in the normal range. Ask your health care provider when your GFR should be checked again. a GFR of less than 60 may mean you have kidney disease. Talk with your health care provider about how to keep your kidney health at this level. a GFR of 15 or less is called kidney failure. Most people below this level need dialysis or a kidney transplant.
