In part 1, the by now classical spectral theory of Banach \ast -algebras is developed, including the Shirali-Ford Theorem (17.14), which is less common for an introduction. In part 2, the theory of states on a normed \ast -algebra is examined, stripped of the usual assumptions of completeness, presence of an approximate unit, and isometry of the involution.

We begin with an introduction to real Clifford algebras and the connection to normed division algebras and braids. We then introduce the tensor construction of the complex Clifford algebra, develop the ideas of root systems and weights of Lie algebras, and construct the spinor module of a Lie algebra from a Clifford algebra. Contents 1. Introduction 2 2. Clifford Algebras over \mathbb{R} and Multivector Subspaces 2 2.1. Clifford Algebras over \mathbb{R}^2

1. Introduction There are exactly four normed division algebras: the real numbers (\mathbb{R}), complex numbers (\mathbb{C}), quaternions (\mathbb{H}), and octonions (\mathbb{O}). The real numbers are the dependable breadwinner of the family, the complete ordered field we all rely on.

1 Introduction to normed algebras and Banach algebras Banach algebras may be thought of as Banach spaces with multiplication (in a sense made more formal below). The additional structure provided by the multiplication gives the theory of Banach algebras a rather different flavour from the more general theory of Banach spaces.
