Magnesium alloys are well-known for being the lightest structural alloys. They are made of magnesium, the lightest structural metal, mixed with other metal elements to improve the physical properties. These elements include manganese, aluminium, zinc, silicon, copper, zirconium, and rare-earth metals.

with other metals, often aluminium, zinc, manganese, silicon, copper, rare earths and zirconium. Magnesium is the lightest structural metal. Magnesium alloys have a hexagonal lattice structure, which affects the fundamental properties of these alloys. Plastic deformation of the hexagonal lattice is more complicated than in cubic latticed metals like aluminium, copper and steel; therefore, magnesium alloys are typically used as cast alloys, but research

connected for some time with the use of rare-earth metals as alloying additives. The rare-earth metals are effective in the improvement of such mechanical properties of Mg alloys like strength at elevated temperatures. At first, the rare-earth additives were used as a mixture known as "mischmetal", which consisted mainly of cerium. Other main constituents of mischmetal were La, Nd, and Pr.

is via alloy composition adjustments, especially the addition of rare earth (RE) elements into Mg alloys. 14, 39-46 The addition of RE elements in Mg alloys can lead to fairly random initial crystallographic texture compared with the RE-free wrought Mg alloys, which leads to improved ductility and strength at both room and elevated temperatures ...
